

Case 1 — Number of Petrol Pumps in Mumbai

DESCRIPTION

Estimate the total number of petrol pumps operating in Greater Mumbai. A demand-side guesstimate combining city population, vehicle penetration, daily fuel consumption per vehicle, and average per-pump throughput.

SELF-REFLECTION

I approached this case using a demand-side framework, segmenting vehicles by type and estimating daily fuel consumption before working backward to pump capacity. My structure was MECE and the final answer of ~1,500 pumps was directionally accurate against real-world data of ~1,400–1,700 pumps. Key assumption I'd refine: commercial vehicle CNG penetration significantly impacts total demand and deserves more precision. I was comfortable with the math but need to improve speed on penetration rate assumptions. I second-guessed myself there. Overall, a clean solve with a defensible structure and a well-calibrated final number.
