

Case 2 — Number of Movie Screens in India

DESCRIPTION

Estimate the total number of movie screens operating in India. A supply-side guesstimate using city-tier segmentation (Tier 1 / Tier 2 / Tier 3) and screen density assumptions per lakh population, anchored on the structural insight that India is underscreened relative to its population.

SELF-REFLECTION

I used a supply-side, geography-based framework segmenting India into Tier 1, Tier 2, and Tier 3 populations and applying screen density assumptions per lakh population. The critical insight was that India is significantly underscreened relative to its population, a structural observation that adds depth beyond just the number. My raw calculation came to ~22,250 screens, but recognising that Tier 3 screen density would be meaningfully lower than my initial assumption, I rounded down to ~20,000, which lands inside the actual range of ~17,500–20,000. Next time I'd stress-test density assumptions earlier by anchoring to known cities before extrapolating nationally. Overall, a structured and defensible solve.
